

NEXT WAVE ®

Using Physioacoustics In Multiple Sclerosis

Physioacoustic treatments have been tested by a range of multiple sclerosis patients, and have found that the method can be used quite safely. The benefits are primarily physical and mental relaxation, decreased muscle tension and improved mobility. These effects last from some hours, to a couple of days.

At the beginning the soft relaxation treatments are recommended. Later the patient can also use the more Intensive program, as long as there are no observed adverse effects of vertigo or nausea.

The best results can be obtained by using individual programs in Next Wave PRO-model.
